

Installation and operating manual

# WSAT-XIN 18.2 - 45.2

Air-cooled liquid chiller for outdoor installation

Dear Customer,

We congratulate you on choosing this product

For many years Clivet has been offering systems that provide maximum comfort, together with high reliability, efficiency, quality and safety.

The aim of the company is to offer advanced systems, that assure the best comfort, reduce energy consumption and the installation and maintenance cost for the life cycle of the system.

The purpose of this manual is to provide you with information that is useful from reception of the equipment, through installation, operational usage and finally disposal so that this advanced system offers the beat solution.

Yours faithfully.

CLIVET Spa

# **1** General description

### 1.1 Manual

The manual provides correct unit installation, use and maintenance. Pay particular attention to:

- $\ref{eq:constraint}$  Warning, identifies particularly important operations or information.
  - Prohibited operations that must not be carried out, that compromise the operating of the unit or may cause damage to persons or things.
  - It is advisable to read it carefully so you will save time during operations.
    - Follow the written indications so you will not cause damages to things and injuries people.

### **1.2 Preliminaries**

Only qualified personnel can operate on the unit, as required by the regulation in force.

### **1.3 Risk situations**

The unit has been designed and created to prevent injures to people.

During designing it is not possible to plane and operate on all risk situation.

Read carefully "Residual risk" section where all situation which may cause damages to things and injuries to people are reported. Installation, starting, maintenance and repair required specific knowledge; if they are carried out by inexperienced personnel, they may cause damages to things and injuries people.

### 1.4 Intended use

Use the unit only:

- for cooling/heating water or a water and glycol mix
- keep to the limits foreseen in the technical schedule and in this manual

The manufacturer accepts no responsibility if the equipment is used for any purpose other than the intended use.

### 1.5 Installation

Outdoor installation

The positioning, hydraulic system, refrigerating, electrics and the ducting of the air must be determined by the system designer in accordance with local regulations in force.

Follow local safety regulations.

Verify that the electrical line characteristics are in compliance with data quotes on the unit serial number label.

### 1.6 Maintenance

Plan periodic inspection and maintenance in order to avoid or reduce repairing costs.

Turn the unit off before any operation.

### 1.7 Modification

All unit modifications will end the warranty coverage and the manufacturer responsibility.

### 1.8 Breakdown/Malfuction

Disable the unit immediately in case of breakdown or malfunction. Contact a certified service agent. Use original spares parts only.

Using the unit in case of breakdown or malfunction:

- voids the warranty
- it may compromise the safety of the unit
- may increase time and repair costs

### 1.9 User training

- The installer has to train the user on:
  - Start-up/shutdown
  - Set points change
  - Standby mode
  - Maintenance
  - What to do / what not to do in case of breakdown

### 1.10 Data update

Continual product improvements may imply manual data changes. Visit manufacturer web site for updated data.

### 1.11 Indications for the User

 $\underline{(\mathbf{N})}$  Keep this manual with the wiring diagram in an accessible place for the operator.

Note the unit data label so you can provide them to the assistance centre in case of intervention (see "Unit identification" section). Provide a unit notebook that allows any interventions carried out on the unit to be noted and tracked making it easier to suitably note the various interventions and aids the search for any breakdowns.

In case of breakdown or malfunction:

- Immediately deactivate the unit
- Contact a service centre authorized by the manufacturer
- The installer must train the user, particularly on:
  - Start-up/shutdown
  - Set points change
  - Standby mode
  - Maintenance
  - What to do / what not to do in case of breakdown

### **1.12 Unit indentification**

The serial number label is positioned on the unit and allows to indentify all the unit features.

N The matriculation plate must never be removed.

The matriculation plate shows the indications foreseen by the standards, in particular:

- unit type
- serial number (12 characters)
- year of manufacture
- wiring diagram number
- electrical data
- manufacturer logo and address

### 1.13 Serial number

It identifies uniquely each unit. Must be quoted when ordering spare parts.

### 1.14 Assistance request

Note data from the serial number label and write them in the chart on side, so you will find them easily when needed.

| Series                   |
|--------------------------|
| Size                     |
| Serial number            |
| Year of manufacture      |
| Electrical wiringdiagram |

## 

# 2 Reception

You have to check before accepting the delivery:

- That the unit hasn't been damaged during transport
- That the materials delivered correspond with that indicated on the transport document comparing the data with the identification label positioned on the packaging.

In case of damage or anomaly:

- Write down on the transport document the damage you found and quote this sentence: "Conditional acceptance clear evidence of deficiencies/damages during transport"
- Contact by fax and registered mail with advice of receipt to supplier and the carrier.
- Any disputes must be made within 8 days from the date of the delivery. Complaints after this period are invalid.

### 2.1 Storage

Observe external packaging instructions.

### 2.2 Handling

- 1. Verify unit weight and handling equipment lifting capacity.
- 2. Identify critical points during handling (disconnected routes, flights, steps, doors).
- 3. Suitably protect the unit to prevent damage.
- 4. lifting brackets
- 5. Lifting with balance
- 6. Lifting with spacer bar
- 7. Align the barycenter to the lifting point
- 8. Use all the lifting brackets (see the dimensional section)
- 9. Gradually bring the lifting belts under tension, making sure they are positioned correctly.
- 10. Before starting the handling, make sure that the unit is stable.

### 2.3 Packaging removing

Be careful not to damage the unit. Keep packing material out of children's reach it may be dangerous. Recycle and dispose of the packaging material in conformity with local regulations.

A Supports for handling: remove after the handling.

B Remove the coil protective mesh before the start-up

# **3** Positioning

During positioning consider these elements:

- Technical spaces requested by the unit
- Electrical connections
- Water connections
- Spaces for air exhaust and intake

### 3.1 Functional spaces

Functional spaces are designed to:

- guarantee good unit operation
- carry out maintenance operations
- protect authorized operators and exposed people
- Respect all functional spaces indicated in the DIMENSIONS section. Double all functional spaces if two or more unit are aligned.

### 3.2 Positioning

/ Units are designed to be installed:

- EXTERNAL
- in fixed positions
- Limit vibration transmission:
- use anti-vibration devices or neoprene strips on the unit support points
- install flexible joints on the hydraulic connections
- install flexible joints on the hydraulic connections
- Choose the installation place according to the following criteria:
- Customer approval
- safe accessible position
- technical spaces requested by the unit
- spaces for the air intake/exhaust
- max. distance allowed by the electrical connections
- install the unit raised from the ground
- verify unit weight and bearing point capacity
- verify that all bearing points are aligned and leveled
- condensate water draining
- consider the maximum possible snow level
- avoid flood-prone places

Protect the unit with suitable fence in order to avoid access to unauthorised personnel (children, vandals, etc.)

A correct circulation of the air is mandatory to guarantee the good unit operating.

Avoid therefore:

- obstacles to the airflow
- difficulty of exchange
- leaves or other foreign bodies that can obstruct the air coil
- winds that hinder or favour the airflow
- heat or pollution sources close to the unit (chimneys, extractors etc..)
- stratification (cold air that stagnates at the bottom)
- recirculation (expelled air that is sucked in again)
- incorrect positioning, close to very high walls, attics or in angles that could give rise to stratification or recirculation phenomenons
- Ignoring the previous indications could:
- reduce energy efficiency
- alarm lockout due to HIGH PRESSURE (in summer) or LOW PRESSURE (in winter)

### 3.3 Saftey valve gas side

The installer is responsible for evaluating the opportunity of installing drain tubes, in conformity with the local regulations in force (EN 378).

### 3.4 AxiTop

### 3.5 Anti-vibration mount support

For details see: 9 Accessories p. 43

# 4 Water connections

### 4.1 Water quality

Water features

- confirming to local regulations
- total hardness < 14°fr
- within the limits indicated by table

The water quality must be checked by qualified personnel. Water with inadequate characteristics can cause:

- pressure drop increase
- reduces energy efficiency
- increased corrosion potential
- Acceptable water quality values:

| РН                                   | 7,5 ÷9,0 |     | Free Chlorine     | < 0,5  | ppm |
|--------------------------------------|----------|-----|-------------------|--------|-----|
| SO4 <sup>2-</sup>                    | < 100    | ppm | Fe <sub>3</sub> ⁺ | < 0,5  | ppm |
| HCO3 <sup>-</sup> /SO4 <sup>2-</sup> | > 1      |     | Mn <sup>++</sup>  | < 0,05 | ppm |
| Total Hardness                       | 4,5 ÷8,5 | dH  | CO <sub>2</sub>   | < 50   | ppm |
| CI                                   | < 50     | ppm | H <sub>2</sub> S  | < 50   | ppb |
| PO4 <sup>3-</sup>                    | < 2,0    | ppm | Temperature       | < 65   | °C  |
| NH3                                  | < 0,5    | ppm | Oxygen content    | < 0,1  | ppm |

Provide a water treatment system if values fall outside the limits.

The warranty does not cover damages caused by limestone formations, deposits and impurities from the water supply and / or failure from failed system clearing to clean system.

### 4.2 Risk of freezing

If the unit or the relative water connections are subject to temperatures close to 0°C:

- mix water with glycol, or
- safeguard the pipes with heating cables placed under the insulation, or
- empty the system in cases of long non-use

### 4.3 Anti-freeze solution

The use of an anti-freeze solution results in an increase in pressure drop.

- Make sure that the glycol type utilized is inhibited (not corrosive) and compatible with the water circuit components.
- O not use different glicol mixture (i.e. ethylene with propylene).

### 4.4 Water flow-rate

The project water-flow must be:

- inside the exchanger operating limits (see the TECHNICAL INFORMATION section)
- guarantee, also with variable system conditions (for example in systems where some circuits are bypassed in particular situations).

### 4.5 Minimum system water content

Minimum system water volumes are described within 'General technical data' section and they have to be satisfied to avoid continuous compressor switching on and off.

### 4.6 Hydraulic connections

- take away the supplied connection union by acting on the connection joint
- weld the union to the installation pipe
- perform the connection between the installation pipe and the evaporator, using the joint
- Retirer le joint de connexion avant de souder le tuyau de l'installation.

 $\bigcirc$ 

The rubber gasket might be irreparably damaged.

### 4.7 Recommended connection

. The installer must define:

- component type
- position in system

- 1 antivibration joints
- 2 piping support
- 3 exchanger chemical cleaning bypass
- 4 drain valve
- 5 vent
- 6 shut-off valve
- 7 Pump / circulating pump
- 8 expansion vessel

# Flow Switch pressure gauge

safety valve

- 12 thermometer
- 13 filter

9

- 14 Internal storage tank
- 15 Cleaning system bypass

4.8 Water filter

Use filter with mesh pitch:

1,6 mm

- It must be installed immediately in the water input of the unit, in a position that is easily accessible for cleaning.
- Note that the second descent the second descent the second descent des

### 4.9 Flow Switch

The flow switch must be present to ensure shutdown of the unit if water is not circulating.
 It has to be installed in a duct rectilinear part, not in proximity of curves that cause turbulences.

A. minimum distance

### 4.10 Operation sequence

Close all vent valves in the high points of the unit hydraulic circuit

Close all drain valves in the low points of the unit hydraulic circuit:

- Heat exchangers
- Pumps
- collectors
- storage tank
- free-cooling coil
- 1. Carefully wash the system with clean water: fill and drain the system several times.
- 2. Apply additives to prevent corrosion, fouling, formation of mud and algae.
- 3. Fill the plant
- 4. Execute leakage test.
- 5. Isolate the pipes to avoid heat dispersions and formation of condensate.
- 6. Leave various point of service free (wells, vent-holes etc).
- Neglecting the washing will lead to several filter cleaning interventions and at worst cases can cause damages to the exchangers and the other parts.

### 4.11 Partial energy recovery

#### Option

A configuration which enables the production of hot water free-of-charge while operating in the cooling mode, thanks to the partial recovery of condensation heat that would otherwise be rejected to the external heat source.

The partial recovery device is considered in operation when it is fed with the flow of water to be heated.

When the temperature of the water to be heated is particularly low, it is wise to insert a flow control valve into the system water circuit, in order to maintain the temperature at the recovery output at above 35°C and thus avoid the condensation of the refrigerant into the partial energy recovery device.

- The recovery exchanger must be always maintained full of water
- $\dot{\mathbb{N}}$  The lack of water amplifies the noise generated by the operation

### 4.12 hydronic assembly

For details see: 9 Accessories p. 43

# 5 Electrical connections

The characteristics of the electrical lines must be determined by qualified electrica personnel able to design electrical installations; moreover, the lines must be in conformity with regulations in force.

The protection devices of the unit power line must be able to stop all short circuit current, the value must be determined in accordance with system features.

The power cables and the protection cable section must be defined in accordance with the characteristics of the protections adopted. All electrical operations should be performed by trained personnel having the necessary qualifications required by the regulations in force and being informed about the risks relevant to these activities.

Operate in compliance with safety regulations in force.

### 5.1 Electrical data

The serial number label reports the unit specific electrical data, included any electrical accessories.

The electrical data indicated in the technical bulletin and in the manual refer to the standard unit, accessories excluded. The matriculation plate shows the indications foreseen by the standards, in particular:

- The matriculation plate shows the indications loreseen
- Voltage
- F.L.A.: full load ampere, absorbed current at maximum admitted conditions
- F.L.I.: full load input, full load power input at max. admissible condition
- Electrical wiringdiagram Nr.

### 5.2 Connections

- 1. Refer to the unit electrical diagram (the number of the diagram is shown on the serial number label).
- 2. Verify that the electrical supply has characteristics conforming to the data shown on the serial number label.
- 3. Before starting work, ensure the unit is isolated, unable to be turned on and a safety sign used.
- 4. Ensure correct earth connection.
- 5. Ensure cables are suitably protected.
- 6. Before powering up the unit, make sure that all the protections that were removed during the electrical connection work have been restored.

### 5.3 Signals / data lines

Do not exceed the maximum power allowed, which varies, according to the type of signal. Lay the cables far from power cables or cables having a different tension and that are able to emit electromagnetic disturbances. Do not lay the cable near devices which can generate electromagnetic interferences. Do not lay the cables parallel to other cables, cable crossings are possible, only if laid at 90°. Connect the screen to the ground, only if there aren't disturbances. Guarantee the continuity of the screen during the entire extension of the cable. Respect impendency, capacity and attenuation indications.

### 5.4 Power input

- Fix the cables: if vacated may be subject to tearing.
- N The cable must not touch the compressor and the refrigerant piping (they reach high temparatures).

### 5.5 Connections performer by customer

🖸 CLIVET '

### 5.6 Computer connection

- 1. Service keypad
- 2. RJ45: standard connection
- 3. P.C.-not supplied
- 4. P.C. connection, shift RJ45 from T-HI to T-IP

#### **Configure P.C.**

- 1. connect P.C. and main module with LAN cable
- 2. check in the taskbar that the connection is active
- 3. open Control Panel and select Network and sharing center
- 4. select Modify board setting
- 5. select Local area connection (LAN)
- 6. select Internet protocol version 4 (TPC) IPV4 and enter Property
- 7. set the IP address 192.168.1.100
- 8. set Subnet mask as 255.255.255.0
- 9. confirm (OK)
- 10. enter Start (Windows button)
- 11. write the command cmd and enter/do it
- 12. write and run the command Ping 192.168.1.42
- 13. the message, connection is OK, will appear when successful
- 14. enter the browser (Crhome, Firefox ecc)
- 15. write and run the command http:/192.168.1.42
- 16. Userid = WEB
- 17. Password = SBTAdmin!

#### **Remote control** 5.7

Option

KNX bus, max 350 mt

### 5.8 Modbus - RS485

#### Option

#### A. Unit

- B. Metal conduit
- C. Metal septums
- D. Metal-lined sheath (sleeve)

#### Modbus / LonWorks / BACnet Cable requirements

Couple of conductors twisted and shielded Section of conductor 0,22mm2...0,35mm2Nominal capacity between conductors < 50 pF/m Nominal impedance  $120 \Omega$ 

Recommended cable BELDEN 3106A

- Every RS485 serial line must be set up using the 'In/Out' bus system.
- Other types of networks are not allowed, such as Star or Ring networks.
- The difference in potential between the earth of the two RS485 devices that the cable shielding needs to be connected to must be lower than 7 V
- There must be suitable arresters to protect the serial lines from the effects of atmospheric discharges
- A 120 ohm resistance must be located on the end of the serial line. Alternatively, when the last serial board is equipped with an internal terminator, it must be enabled using the specific jumper, dip switch or link.
- The cable must have insulation features and non-flame propagation in accordance with applicable regulations.
- The RS485 serial line must be kept as far away as possible from sources of electromagnetic interference.

### 5.9 LonWorks

Option

red flashing: communicating not possible communication down

### 5.10 BACnet IP

fixed: hardware error

#### Option

| LED BSP | communication with AP1 module                  | LED BUS | communication with  |
|---------|--|---------|---------------------|
| green   | communication ok                               | green   | ready for communica |
| yellow  | software ok but communication with AP1<br>down | yellow  | startup             |
| red     | flashing: software error                       | red     | BACnet server down  |
|         | fixed: hardware error                          |         | restart after 3 sec |

# 6 Start-up

### 6.1 General description

The indicated operations should be done by qualified technician with specific training on the product. Upon request, the service centres performing the start-up. Agree upon in advance the star-up data with the service centre.

The electrical, water connections and the other system works are by the installer.

### 6.2 Preliminary checks

For details refer to the different manual sections. Before checking, please verify the following:

- the unit should be installed properly and in conformity with this manual
- the electrical power supply line should be isolated at the beginning
- the unit isolator is open, locked and equipped with the suitable warning
- make sure no tension is present
- After turning off the power, wait at least 5 minutes before accessing to the electrical panel or any other electrical component.
- Before accessing check with a multimeter that there are no residual stresses.

#### **Unit OFF power supply**

- 1. safety access
- 2. functional spaces
- 3. air flow: correct return and supply (no bypass, no stratification)
- 4. structure integrity
- 5. fans run freely
- 6. unit on vibration isolators
- 7. unit input water filter + shut-off valves for cleaning
- 8. vibration isolators on water connections
- 9. expansion tank (indicative volume = 5% system content)
- 10. cleaned system
- 11. loaded system + possible glycol solution + corrosion inhibitor
- 12. system under pressure
- 13. vented system
- 14. refrigerant circuit visual check
- 15. earthing connection
- 16. power supply features
- 17. electrical connections provided by the customer

### 6.3 Start-up sequence

For details refer to the different manual sections.

#### Unit ON power supply

- 1. compressor crankcase heaters operating at least since 8 hours
- 2. off-load voltage measure
- 3. phase sequence check
- 4. pump manual start-up and flow check
- 5. shut-off valve refrigerant circuit open
- 6. unit ON
- 7. load voltage measure and absorptions
- 8. liquid sight glass check (no bubbles)
- 9. check all fan operating
- 10. measure return and supply water temperature
- 11. measure super-heating and sub-cooling
- 12. check no anomalous vibrations are present
- 13. climatic curve personalization
- 14. climatic curve personalization
- 15. scheduling personalization
- 16. complete and available unit documentation

### 6.4 Refrigeration circuit

- 1. Check carefully the refrigerating circuit: the presence of oil stains can mean leakage caused by transportation, movements or other).
- 2. Verify that the refrigerating circuit is in pressure: Using the unit manometers, if present, or service manometers.
- 3. Make sure that all the service outlets are closed with proper caps; if caps are not present a leak of refrigerant can be possible.
- 4. Open the valves of the refrigerant circuit, if there are any.

### 6.5 Water circuit

- 1. Before realizing the unit connection make sure that the hydraulic system has been cleaned up and the cleaning water has been drained.
- 2. Check that the water circuit has been filled and pressurized.
- 3. Check that the shut-off valves in the circuit are in the "OPEN" position.
- 4. Check that there isn't air in the circuit, if required, evacuate it using the air bleed valve placed in the system high points.
- 5. When using antifreeze solutions, make sure the glycol percentage is suitable for the type of use envisaged.

A Neglecting the washing will lead to several filter cleaning interventions and at worst cases can cause damages to the exchangers and the other parts.

| Weight of glycol (%)      | 10   | 20   | 30    | 40    |
|---------------------------|------|------|-------|-------|
| Freezing temperature (°C) | -3.9 | -8.9 | -15.6 | -23.4 |
| Safety temperature (°C)   | -1   | -4   | -10   | -19   |

### 6.6 Electric Circuit

Verify that the unit is connected to the ground plant.

Check the conductors are tightened as: the vibrations caused by handling and transport might cause these to come loose. Connect the unit by closing the sectioning device, but leave it on OFF.

Check the voltage and line frequency values which must be within the limits: 400/3/50 +/- 10%

Check and adjust the phase balance as necessary: it must be lower than 2% Example

L1 L2 L3 388V + 379V + 377 = 381 (A) 388V + 379V + 377 = 381 (A)2) MAX - A = 388 - 381 = 7 3) S =  $\frac{7}{A}$  x 100 = 1,83 OK

Working outside of these limits can cause irreversible damages and voids the warranty.

### 6.7 Compressor crankcase heaters

Connect the oil resistances on the compressor crankcase at least 8 hours before the compressor is to be starter:

- at the first unit start-up
- after each prolonged period of inactivity
- 1. Supply the resistances switching off the unit isolator switch.
- 2. To make sure that heaters are working, check the power input.
- 3. At start-up the compressor crank-case temperature on the lower side must be higher at least of 10°C than the outside temperature.

O not start the compressor with the crankcase oil below operating temperature.

### 6.8 Remote controls

Check that the remote controls (ON-OFF etc) are connected and, if necessary, enabled with the respective parameters as indicated in the "electrical connections" section.

Check that probes and optional components are connected and enabled with the respective parameters ("electrical connections" section and following pages).

### 6.9 Voltages

Check that the air and water temperatures are within in the operating limits. Start-up the unit.

With unit operating in stable conditions, check:

- Voltage
- Total absorption of the unit
- Absorption of the single electric loads

### 6.10 Demand limit

- Menu accessible only after having entered the password.
- Access reserved only to specifically trained personnel.
- $\underline{\ref{eq:constraint}}$  The parameter modification can cause irreversible damages.

It is possible to limit the absorbed electric power with an external signal 0-10 Vcc.

The higher the signal is, the lower the number of compressors available to meet the thermal need.

If only P0002: EnDemandLimit  $\neq 0$ 

Path: Main Menu / Unit parameters / Demand limit

| Step | Display         | Action       | Menu/Variable     | Ке           | ys                | Notes |

### 6.13 ECOSHARE function for the automatic management of a group of units

- Max 7 units
- Maximum length of the bus line: 700 m.
- Maximum distance between 2 units: 300 m
- Type of cable: shielded twisted pair cable Ø 0,8 mm. use an EIB/KNX cable
- Possible connections: Tree, star, in/out bus, mixed
- It is not possible to use a ring connection
- No end-of-line resistor or terminator required
- There must be suitable arresters to protect the serial lines from the effects of atmospheric discharges
- The data line must be kept separate from the power conductors or powered at different voltage values and away from possible sources of electrical interference

If there are more units connected in a local network set the mode of operation.

#### **MODE A**

Every unit manages its own compressors according to the setpoint. Every unit optimizes its refrigeration circuits.

Pumps always active, even with compressor stoped.

P0658 = 0

P0657 > 0 °C

setpoint1 > setpoint2 > setpoint3
or
setpoint1 < setpoint2 < setpoint3</pre>

### MODE B

The master manages the single cooling. The master optimizes individual refrigerant circuits. Pumps always active, even with compressor stoped. P0658 = 1 P0657 = 0 °C setpoint1 = setpoint2 = setpoint3 plus: optimal H2O temperature control

|   | 1 | 2 | 3        |      |
|---|---|---|----------|------|
| <b>MODE C</b><br>The master manages the single cooling. |   |   |          |      |
| The master optimizes individual refrigerant circuits.   |   |   |          | LOAD |
| Active pumps only with active compressors.              |   |   | $\wedge$ |      |
| P0658 = 2   |   |   | Y        |      |
| P0657 = 0 °C  |   |   |          |      |
| setpoint1 = setpoint2 = setpoint3                       |   |   |          |      |

plus: minimum pumps consumption need balanced system (t1 = t2 = t3)

#### Path: Main Menu / Unit parameters / Master Slave

| Parameters | Short description | Description  |
|------------|-------------------|--|
| P0655      | LNinstalledUnits  | Number of network-connected units including the master   |

| P0657      | LNOffset          | Temperature Offset the master sum or subtract, depending on the way you set, in order of priority, to the set point of the slave |
| P0658      | TypeRegMS         | Operation mode: 0=mode A; 1=mode B; 2=mode C   |
| P0659      | LNAddress         | ProcessBus address unit  |

### 6.14 Evaporator water flow-rate

Check that the difference between the temperature of exchanger return and supply water corresponds to power according to this formula: unit cooling power (kW) x 860 = Dt ( $^{\circ}$ C) x flow rate (L/h)

The cooling power is shown in the table of the GENERAL TECHNICAL DATA included in this manual, referred to specific conditions, or in the tables on COOLING PERFORMANCE in the TECHNICAL BULLETIN referred to various conditions of use.

Check for water side exchanger pressure drops:

determine the water flow rate

measure the difference in pressure between exchanger input and output and compare it with the graph on WATER SIDE EXCHANGER PRESSURE DROPS

The measurement of pressure will be easier if pressure gauges are installed as indicated in the DIAGRAM OF SUGGESTED WATER CONNECTIONS.

### 6.15 Scroll compressor

The Scroll compressors have only one rotation direction.

In the event it is reversed, the compressor is not immediately damaged, but increases its noise and jeopardises pumping.

After a few minutes, the compressor blocks due to intervention of the thermal protection.

In this case, disconnect power supply and invert 2 phases on the machine power supply.

Avoid the compressor working for a long time with contrary rotation: more than 2-3 of these anomalous start-ups can damage it.

To ensure the rotation direction is correct, measure the condensation and suction pressure.

The pressures must significantly differ: upon start-up, the suction pressure decreases whereas the condensation one, increases.

### 6.16 Operating at reduced load

The units are equipped with partialization steps and they can, therefore, operate with reduced loads.

However a constant and long operation with reduced load with frequent stop and start-up of the compressor/s can cause serious damages for the lack of oil return.

The above-described operating conditions must be considered outside the operating limits.

In the event of compressor breakdown, due to operating in the above-mentioned conditions, the guarantee will not be valid and Clivet spa declines any responsibility.

Check periodically the average operating times and the frequency of the compressors starts: approximately the minimum thermal load should be such as to need the operating of a compressor for at least ten minutes.

If the average times are close to this limit, take the proper corrective actions.

### 6.17 Start-up report

Identifying the operating objective conditions is useful to control the unit over time.

With unit at steady state, i.e. in stable and close-to-work conditions, identify the following data:

- total voltages and absorptions with unit at full load
- absorptions of the different electric loads (compressors, fans, pumps etc)
- temperatures and flows of the different fluids (water, air) both in input and in output from the unit

• temperature and pressures on the characteristic points of the refrigerating circuit (compressor discharge, liquid, intake)

The measurements must be kept and made available during maintenance interventions.

### 6.18 2014/68/UE PED directive

DIRECTIVE 2014/68/UE PED gives instructions for installers, users and maintenance technicians as well. Refer to local regulations; briefly and as an example, see the following:

Compulsory verification of the first installation:

- only for units assembled on the installer's building site (for ex. Condensing circuit + direct expansion unit)
- Certification of setting in service:
- for all the units

Periodical verifications:

• to be executed with the frequency indicated by the Manufacturer (see the "maintenance inspections" paragraph)

### 7.10 Alarms

- Perform resetting an alarm identify and remove its cause.

   Repeated resets can cause irreversible damage.

   Example:
  - + eE0001: Phase monitor: Fault = active alarm
  - EE0003: Pum 1 faulty: Ok = resetted alarm
  - Display of alarm: step 1-3
  - Reset allarm: step 4-10

# 8 Maintenance

## 8.1 General description

Maintenance must be done by authorized centres or by qualified personnel.

- The maintenance allows to:
- maintain the unit efficiency
- increase the life span of the equipment
- assemble information and data to understand the state of the unit efficiency and avoid possible damages
- Before checking, please verify the following:
- the electrical power supply line should be isolated at the beginning
- the unit isolator is open, locked and equipped with the suitable warning
- make sure no tension is present
- After turning off the power, wait at least 5 minutes before accessing to the electrical panel or any other electrical component.
- Before accessing check with a multimeter that there are no residual stresses.

## 8.2 Inspections frequency

 $\triangle$ 

Perform an inspection every 6 months minimum. The frequency, however, depends on the use.

- In the event of frequent use it is recommended to plan inspections at shorter intervals:
- frequent use (continuous or very intermittent use, near the operating limits, etc)
- critical use (service necessary)

| √  | intervention frequency (months)  | 1 | 6 | 12 |
|----|--|---|---|----|
| 1  | presence corrosion   |   |   | Х  |
| 2  | panel fixing   |   |   | Х  |
| 3  | fan fixing   |   | Х |    |
| 4  | coil cleaning  |   | Х |    |
| 5  | water filter cleaning  |   | Х |    |
| 6  | water: quality, ph, weight of glycol (%)   |   | Х |    |
| 7  | check the exchanger efficiency   |   |   | Х  |
| 8  | circulating pumps  |   | Х |    |
| 9  | check of the fixing and the insulation of the power lead   |   |   | Х  |
| 10 | check of the earthing cable  |   |   | Х  |
| 11 | electric panel cleaning  |   |   | Х  |
| 12 | capacity contactor status  |   |   | Х  |
| 13 | termina closing, cable insulation integrity  |   |   | Х  |
| 14 | voltage and phase unbalancing (no load and on-load)  |   | Х |    |
| 15 | absorptions of the single electrical loads   |   | Х |    |
| 16 | test of the compressor crankcase heaters   |   | Х |    |
| 17 | Checking for leaks   |   |   | *  |
| 18 | survey of the refrigerant circuit operating parameters   |   | Х |    |
| 19 | safety valve   |   |   | *  |
| 20 | protective device test: pressure switches, thermostats, flow switches etc                                  |   | Х |    |
| 21 | control system test: setpoint, climatic compensations, capacity stepping, water / air flow-rate variations |   | Х |    |
| 22 | control device test: alarm signalling, thermometers, probes, pressure gauges etc                           |   | Х |    |

\* Refer to the local regulations; and ensure correct adherance. Companies and technicians that effect interventions of installation, maintenance/repairs, leak control and recovery must be CERTIFIED as expected by the local regulations. The leak control must be effected with annual renewal.

# 8.3 Unit booklet

It's advisable to create a unit booklet to take notes of the unit interventions. In this way it will be easier to adequately note the various interventions and aid any troubleshooting. Report on the booklet:

- date
- intervention description
- carried out measures etc.

## 8.4 Standby mode

If a long period of inactivity is foreseen:

- turn off the power
- avoid the risk of frost (empty the system or add glycol)
- Turn off the power to avoid electrical risks or damages by lightning strikes.
- With lower temperatures keep heaters turned on in of the electrical panel (option).

It's recommended that the re-start after the stopping period is performed by a qualified technician, especially after seasonal stops or seasonal switching.

When restarting, refer to what is indicated in the "start-up" section.

Schedule technical assistance in advance to avoid hitches and to guarantee that the system can be used when required.

## 8.5 Air coil

Contact with the exchanger fins can cause cuts: wear protective gloves to perform the above described operations.

It is extremely important that the battery gives the maximum thermal exchange; therefore, its surface must be cleaned from dust and deposits. Remove all impurities from the surface.

Using an air pressure gun, clean the aluminum surface of the battery; be careful to direct the air in the opposite direction of the fan air movement.

Hold the gun parallel to the fins to avoid damages.

As an alternative, vacumn cleaner can be used to suck impurities from the air input side.

Verify that the aluminum fins are not bent or damaged, in the event of damages contact the authorized assistance center and get the fins straightened in order to restore the initial condition for an optimal air flow.

# 8.6 Electric fans

Check:

- the fans and the relative protection gridsare well fixed
- the fan bearings (evident by noise and anomalous vibrations)
- the terminal protection covers are closed and the cable holders are properly positioned

## 8.7 Water side exchanger

It is very important for the exchanger to be able to provide the maximum thermal exchange, therefore it is essential for the inner surfaces to be clean of dirt and incrustations.

Periodically check the difference between the temperature of the supply water and the condensation temperature: if the difference is greater than  $8^{\circ}C-10^{\circ}C$  it is advisable to clean the exchanger.

The clearing must be effected:

- with circulation opposite to the usual one
- with a speed at least 1,5 times higher than the nominal one
- with an appropriate product moderately acid (95% water + 5% phosphoric acid)
- after the cleaning rinse with water to inhibit the action of any residual product

## 8.8 Circulating pumps

Check:

- no leaks
- bearing status (anomalies are highlighted by abnormal noise and vibration)
- the terminal protection covers are closed and the cable holders are properly positioned

### 8.9 Water filter

Check that no impurities prevent the correct passage of water.

### 8.10 Flow Switch

- controls the operations
- remove incrustations from the palette

### 8.11 Compressor supply line shut-off valve

Do not remove the seal
 Remove only if authorized by the manufacturer.
 Please contact the maker for informations.

### 8.12 crankcase heather

Check:

- closure
- Operation

# 8.13 Copeland scroll compressor

## 8.14 Insulations

Check the condition of the insulations: if necessary apply glue and and renew the seals.

### 8.15 System discharge

- 1. evacuate the system
- 2. evacuate the exchanger, use all the cocks presents
- 3. use compressed air to blow the exchanger
- 4. dry completely the exchanger by an hot air jet; for greater safety fill the exchanger with glycoled solution
- 5. protect the exchanger from the air
- 6. remove the drain plugs to the pumps
- Any anti-freeze liquid contained in the system should not be discharged freely as it is a pollutant.

It must be collected and reused. Before starting a washing the plant.

# 10 Decommissioning

## **10.1 Disconnecting**

Only authorised personnel must disconnect the unit.

Avoid leak or spills into the environment.

Before disconnecting the unit, the following must be recovered, if present:

- refrigerant gas
- anti-freeze solutions in the water circuit

Awaiting dismantling and disposal, the unit can also be stored outdoors, if the electrical, cooling and water circuits of the unit have 100% integrity and are isolated, bad weather and rapid change in temperature will not result in any environmental impact.

## 10.2 Dismantling and disposal

The unit must always be sent to authorised centres for dismantling and disposal.

When dismantling the unit, the fan, the motor and the coil, if operating, may be recovered by the specialist centres for reuse.

All the materials must be recovered or disposed of in compliance with the corresponding national standards in force.

For further information on the decommissioning of the unit, contact the manufacturer.

### **10.3 Directive EC RAEE**

The units covered by the legislation in question are marked with the symbol on the side.

With the aim of protecting the environment, all of our units are produced in compliance with Directive EC on waste electrical and electronic equipment (RAEE).

The potential effects on the environment and on human health due to the presence of hazardous substances are shown in the use and maintenance manual in the section on residual risks.

Information in addition to that indicated below, if required, can be obtained from the manufacturer/distributor/importer, who are responsible for the collection/handling of waste originating from equipment covered by EC-RAEE. This information is also available from the retailer who sold this appliance or from the local authorities who handle waste.

Directive EC-RAEE requires disposal and recycling of electrical and electronic equipment as described therein to be handled through appropriate collection, in suitable centres, separate from collection for the disposal of mixed urban waste.

The user must not dispose of the unit at the end of its life cycle as urban waste, it must instead be handed over to appropriate collection centres as set forth by current standards or as instructed by the distributor.

# 11 Residual risks

#### **General description**

In this section the most common situations are indicated, as these cannot be controlled by the manufacturer and could be a source of risk situations for people or things

Danger zone

This is an area in which only an authorised operator may work.

The danger zone is the area inside the unit which is accessible only with the deliberate removal of protections or parts thereof.

#### Handling

The handling operations, if implemented without all of the protection necesssary and without due caution, may cause the drop or the tipping of the unit with the consequent damage, even serious, to persons, things or the unit itself.

Handle the unit following the instructions provided in the present manual regarding the packaging and in compliance with the local regulations in force. Should the refrigerant leak please refer to the refrigerant "Safety sheet". Installation

The incorrect installation of the unit could cause water leaks, condensate accumulation, leaking of the refrigerant, electric shock, poor operation or damage to the unit itself.

Check that the installation has been implemented by qualified technical personnel only and that the instructions contained in the present manual and the local regulations in force have been adhered to.

The installation of the unit in a place where even infrequent leaks of inflam-mable gas and the accumulation of this gas in the area surrounding the area occur could cause explosions or fires.

Carefully check the positioning of the unit.

The installation of the unit in a place unsuited to support its weight and/or guarantee adequate anchorage may result in consequent damage to things, people or the unit itself.

Carefully check the positioning and the anchoring of the unit. Easy access to the unit by children, unauthorised persons or animals may be the source of accidents, some serious.

Install the unit in areas which are only accessible to authorised person and/or provide protection against intrusion into the danger zone.

General risks

Smell of burning, smoke or other signals of serious anomalies may indicate a situation which could cause damage to people, things or the unit itself. Electrically isolate the unit (vellow-red isolator).

Contact the authorised service centre to identify and resolve the problem at the source of the anomaly.

Accidental contact with exchange batteries, compressors, air delivery tubes or other components may cause injuries and/or burns.

Always wear suitable clothing including protective gloves to work inside the danger zone.

Maintenance and repair operations carried out by non-qualified personnel may cause damage to persons, things or the unit itself.

Always contact the qualified assistance centre.

Failing to close the unit panels or failure to check the correct tightening of all of the panelling fixing screws may cause damage to persons, things or the unit itself.

Periodically check that all of the panels are correctly closed and fixed. If there is a fire the temperature of the refrigerant could reach values that in-

crease the pressure to beyond the safety valve with the consequent possible projection of the refrigerant itself or explosion of the circuit parts that remain

isolated by the closure of the tap. Do not remain in the vicinity of the safety valve and never leave the refrigerating system taps closed.

#### **Electric parts**

An incomplete attachment line to the electric network or with incorrectly sized cables and/or unsuitable protective devices can cause electric shocks, intoxication, damage to the unit or fires.

Carry out all of the work on the electric system referring to the electric layout and the present manual ensuing the use of a system thereto dedicated. An incorrect fixing of the electric components cover may lead to the entry of dust, water etc inside and may consequently electric shocks, damage to the unit or fires

Always fix the unit cover properly. When the metallic mass of the unit is under voltage and is not correctly connected to the earthing system it may be as source of electric shock and electrocution.

Always pay particular attention to the implementation of the earthing system connections.

Contact with parts under voltage accessible inside the unit after the removal of the guards can cause electric shocks, burns and electrocution. Open and padlock the general isolator prior to removing the guards and

Signal work in progress with the appropriate sign. Contact with parts that could be under voltage due to the start up of the unit

may cause electric shocks, burns and electrocution. When voltage is necessary for the circuit open the isolator on the attachment line of the unit itself, padlock it and display the appropriate warning sign. Moving parts

Contact with the transmissions or with the fan aspiration can cause injuries. Prior to entering the inside of the unit open the isolater situated on the con-nection line of the unit itself, padlock and display the appropriate warning sian.

Contact with the fans can cause injury.

Prior to removing the protective grill or the fans, open the isolator on the attachment line of the unit itself, padlock it and display the appropriate warning sign

#### Refrigerant

The intervention of the safety valve and the consequent expulsion of the gas refrigerant may cause injuries and intoxication.

Always wear suitable clothing including protective gloves and eyeglasses for operations inside the danger zone.

Should the refrigerant leak please refer to the refrigerant "Safety sheet". Contact between open flames or heat sources with the refrigerant or the heating of the gas circuit under pressure (e.g. during welding operations) may cause explosions or fires.

Do not place any heat source inside the danger zone.

The maintenance or repair interventions which include welding must be carried out with the system off.

#### Hydraulic parts

Defects in tubing, the attachments or the removal parts may cause a leak or water projection with the consequent damages to people, things or shortcircuit the unit.

Data referred to the following conditions: Internal exchanger water temperature = 12/7°C Entering external exchanger air temperature = 35°C
 The Total Power Input value does not take into account the part related to the pumps and required to overcome the pressure drops for the circulation of the solution inside the exchangers
 Data compliant to Standard EN 14511:2013 referred to the following conditions: - Internal exchanger water temperature = 12/7°C - Entering external exchanger air temperature = 35°C
 PHE = plate exchanger
 AX = axial fan

Sound levels refer to units with full load under nominal test conditions.

The sound pressure level refers to a distance of 1 meter from the outer surface of the unit operating in open field.

Noise levels are determined using the tensiometric method (UNI EN ISO 9614-2)

Data referred to the following conditions:

internal exchanger water =  $12/7^{\circ}C$ 

ambient temperature = 35 °C

# Unit with HEDIF - "Diffuser for high efficiency axial fan" option
