Clivet is taking part in the EUROVENT certification programme up to 1.500 kW. The products concerned appear in the certified products list of the EUROVENT www.eurovent-certification.com site.

Features

CLIVETPack for medium attendance applications

The CSNX-XHE2 units are high performance stand-alone air conditioners designed to treat large volumes of external air, used specifically in high occupancy venues such as: multiplex cinemas, convention rooms, restaurants and performance venues in general.

The entire series is characterised by a dual refrigeration circuit with scroll compressors connected in tandem to the single circuit. This solution makes it possible to follow the trend of the thermal load even in mid-seasons, reaching very high seasonal performance as required by the ErP 2021 regulations.

Clivet rooftop are Eurovent certified products

The ClivetPack2 series has the Eurovent Certified Performance quality mark, which means it has been tested strictly in accordance with the European standards. This provides an additional guarantee for the customer; in fact, the Eurovent tests confirm the performance of the product and permit accurate analysis of the running costs: "Total Life Cycle Cost".

The single-block design of all of the plant engineering parts are contained inside the unit, already assembled and inspected.

There are two main configurations with the recovery of energy from exhaust air which both permit the integration of a vast range of accessories to customise the product according to the application.

- ✓ Independent dual refrigeration circuit with two scroll compressors connected in parallel that allow for up to 3 partialisation steps per circuit.
- ✓ Radial fans directly coupled to EC brushless motors (plug fans) permit control of the airflow for adapting to the characteristics of the aerodynamic system. On both the supply and the exhaust section.
- ✓ Filtration of air in several stages, from coarse particles (G4 filters) to classes of absolute filtration (electronic filters).
- ✓ Constant or variable control of the flow of supply air.
- ✓ Automatic and variable control of the amount of fresh air based on the actual requirement of occupants, with air quality probe.
- ✓ Freecooling function when it is possible to use outdoor air directly to meet the internal loads.
- ✓ Great flexibility of the distribution of air, with the possibility of connecting a roofcurb for supply and/or return from below.
- ✓ Summer dehumidification function with hot-gas post-heating to increase comfort even with high latent loads
- ✓ Heating solutions that can be used together with or instead of the heat pump: electric heaters, hot water coil, modulating gas module with condensation technology.
- ✓ Winter humidification systems integrated in the unit.
- ✓ Possibility of integration in the main supervisory systems with communication protocol: ModBus, LonWorks, Bacnet.

All the accessories are cabled and supplied on board the unit unless specified otherwise.

Automatic management of the air flow

Constant airflow (PCOSM) (standard function)

The supply airflow remains constant even if the filters get progressively clogged, thus compensating for the increased load drops.

ECO mode (standard function)

The air flow supply remains constant at varied heat loads and is shutdown when the load is fulfilled (dead zone). To further increase the energy savings in this condition, it is also possible to set less demanding operation setpoints for the unit in respect to the standard mode. This function is indicated for the thermal maintenance of the served area in case it is temporarily not used, which can for example occur at night.

The ECO mode can be activated:

- manually
- automatically from supervisor input signal

Variable airflow (PVAR option)

The air flow supply varies depending on the heat load, up to a minimum value compatible with the distribution system and the chosen air diffusion.

The ventilation remains active even when the load is fulfilled (dead zone).

This option allows a further energy savings.

- The movement of the air is always active during the operation of the rooftop unit.
- It determines an annual energy consumption comparable or even greater than the compressors.
- The reduction of 20% of the flow generates a saving of 50% on energy absorbed by the ventilators.
- With a reduction of the flow equal to 40%, the saving for ventilation exceeds 70%
- The variable airflow can therefore lead to a saving of 30% on an overall electrical consumption of the unit.

Features

Smart management of defrosts

The automatic defrost cycles on the remaining external exchanger surface are managed in predictive mode, reducing both the frequency and the duration. The built-in electronics analyses not only the external conditions, but also the evaporation pressure variation in the exchanger.

The standard management of the defrosting cycles enables one circuit at a time without stopping ventilation. This reduces the time required for defrosting while preventing excessively cold air from being introduced into the room, thus maintaining comfort conditions for users.

Set-point automatic compensation

With this function as standard, the temperature set-point can automatically vary in view of the outdoor temperature and of the User settings:

- further increases the energy saving;
- reduces the temperature difference between the outside and the served area, increasing the user comfort.

Ambient pressure control

The ambient pressure control device compares the return pressure with the external pressure and compensates any variations by acting on the outdoor air damper.

This way, the unit maintains the relevant ambient pressure desired by the user, who can choose between the overpressure, depression or equal-pressure.

The room pressure control device is fitted as standard in the units with extraction and exhaust (Clivet reference code CCK and CCKP)

Simple and intuitive user interface

An innovative graphic interface prepared for wall-installation (with 230V power supply and wiring at the customer's care) is supplied as standard, with the option to be removed from the support and connected on-board for maintenance operations.

Among the main functions it allows to:

- the temperature and humidity measurement is made by probes into the unit;
- daily/weekly start-up or power-off programming of the unit;
- operating mode (heat or cool) and/or set-point manual change;
- alarm and unit status display;
- operating parameter management.

CCK - double fan section for recirculation, fresh air, exhaust, thermodynamic recovery

For applications with automatic air renewal and free-cooling function control. The unit is equipped with an exhaust section with thermodynamic energy recovery of the exhaust air. This air, which is still rich in energy, is mixed with the outdoor air, favouring the temperature conditions on the source side of the exchanger and improving the heating and cooling capacity. Thermodynamic recovery is also included in the CCK configuration and uses the technology of refrigeration circuit with direct expansion.

The unit is equipped with an electronically controlled exhaust fan section that automatically controls the amount of air to reject. The exhaust air flow is, in fact, directed onto the external finned coil exchanger which is accordingly thermally favoured in its operation cycle. The recovered energy is transferred by the handling exchanger and therefore transferred directly to the supply air.

CCKP - double fan section with fresh air and THOR thermodynamic recovery

For applications with automatic air renewal and free-cooling function control. In addition to the parts contained in the CCK configuration, the unit is equipped with an exhaust section with innovative thermodynamic energy recovery of the exhaust air through a dedicated THOR (THERmodynamic Overboost Recovery) exchanger. The energy contained in the exhaust air is recovered and transferred to handling through the refrigeration circuit. The innovative THOR recovery (THERmodynamic Overboost Recovery) is always included in the CCKP configuration and uses direct expansion refrigeration circuit technology. The unit is equipped with an electronically controlled exhaust fan section that automatically adjusts the amount of air to reject. The exhaust air flow is directed by the exchanger dedicated to recovery, which is an integral part of the refrigeration circuit. The amount of recovered energy is easily measurable like the static heat recovery.

Winter and summer energy recovery provides a dual positive effect: it increases the capacity and offers a significant energy savings. The main benefits of the energy recovery:

- it increases the total unit efficiency;
- it eliminates the greater part of electrical power consumption for the ventilation of passive recovery devices, which also significantly reduce the effective amount of recovered energy;
- in terms of heat pump operation, it reduces the formation of ice on the exchanger and therefore the number of defrost cycles. Thereby increasing operation continuity and overall system efficiency;
- it is also effective for cooling operations, especially in continental and temperate climates where passive recovery device output is essentially negligible due to a low outdoor and indoor temperature difference and enthalpy;
- it keeps the unit compact and simplifies its positioning

R. Return air

Filter nomenclature in accordance with EN ISO 16890

The classification of air filters is based on the ability to retain airborne particulate matter. To make it possible and easier to select appropriate filters according to different applications, a new global standard for filtration has been recently introduced: EN ISO 16890. It defines a new and alternative classification for air filters based on their ability to retain dispersed airborne particulate matter (PM10, PM2.5 and PM1) through new, more stringent and specific test methods. The previous standards in force, such as EN 779-2012, ASHRAE 52.2 and other local standards, are thus unified for all countries worldwide. Below, the correlation between the traditional nomenclature and the new standard for filters used in Clivet units. For easier reading, both names have been kept in the text.

1st stage of filtration (standard)	G4	ISO 16890 Coarse 60%
2st stage of filtration (optional)	F7	ISO 16890 ePM1 55%
2st stage of filtration (optional)	FES (electronic filters)	ISO 16890 ePM1 90%

Configuration with double fan section for recirculation, fresh air, exhaust, thermodynamic recovery (CCK)

Compressor

Hermetic orbiting scroll compressor complete with motor over-temperature and over-current devices and protection against excessive gas discharge temperature. Fitted on rubber anti-vibration mounts and complete with oil charge. The oil heater is automatically activated to prevent the oil from being diluted by the refrigerant when the compressor stops. The compressors are connected in TANDEM on a single refrigeration circuit and have a biphasic oil equalisation.

Sizes 12.3-15.3 a cooling circuit is supplied with a single compressor.

Structure

The support base is assembled with a painted galvanized steel frame. The internal structure is made of zinc - magnesium bent galvanized steel. The alloy Zn - Mg allows an excellent corrosion proofing thanks to the galvanic protection typical of the combination zinc - magnesium.

Panelling

Sandwich panels in the air treatment section with dual walls in steel sheet metal with polyurethane insulation (40 kg/m³), thickness of outer sheet metal 6/10 mm galvanized and painted using polyester powders colour RAL 9001, polyurethane thickness 30 mm with thermal conductivity coefficient 0.022W/mK, thickness of internal sheet metal 5/10 mm hot galvanized. The access door panels for the routine maintenance are provided with a PVC profile for thermal insulation and a EPDM rubber gasket that ensures the hermetic seal.

All panelling can easily be removed to allow complete accessibility to internal components.

Air renewal management

The unit is supplied with an outdoor air modulating damper to manage air renewal and free cooling.

The damper is made of aluminium and has sealing gaskets at the ends of the fins; the actuator proportionally adjusts the opening by moving the pin connected to the plastic gears.

Internal exchanger

Direct expansion finned coil exchanger made with copper pipes placed on staggered rows mechanically expanded to better adhere to the fin collar. The fins are made from aluminium with a corrugated surface and adequately distanced to ensure the maximum heat exchange efficiency.

External exchanger

Direct expansion finned coil exchanger made with copper pipes placed on staggered rows mechanically expanded to better adhere to the fin collar. The fins are made from aluminium with a corrugated surface and adequately distanced to ensure the maximum heat exchange efficiency.

A correct power supply to the expansion valve is ensured by the subcooling circuit; this circuit also prevents the formation of ice at the base of the heat exchanger during winter operation.

Fan

Internal section

Plug fans without scroll with reverse blades driven by electronically-controlled "brushless" dc motors with direct coupling. No transmission sizing is needed. The motor is in compliance with ErP 2015 according to Regulation UE 640/2009. Class IE4.

Exhaust fan

Plug fans without scroll with reverse blades driven by electronically-controlled "brushless" DC motors with direct coupling. No drive sizing is required. The motor is in compliance with ErP 2015 according to Regulation UE 640/2009. Class IE4.

External section

Helical fans with die-cast aluminium blades, directly coupled to a three-phase electric motor with external rotor, with built-in thermal overload protection, IP 54 index of protection. Housed inside an aerodynamically shaped nozzles to increase efficiency and minimise noise levels; fitted with safety grills. The motor is in compliance with ErP 2015 according to Regulation UE 640/2009.

Thermodynamic recovery on the exhaust air

The energy content of the exhaust air is recovered by the external exchanger, through a dedicated fan section. The favourable air temperature on the source side increases unit capacity.

Refrigeration circuit

Refrigeration circuit with:

- refrigerant charge;
- liquid flow and moisture indicator;
- safety high pressure switch;
- filter dryer;
- electronic expansion valve;
- non-return valve;
- 4-way reverse cycle valve;
- liquid receiver;
- liquid separator;
- high pressure safety valve;
- low pressure safety valve.

Filtration

Outdoor air inlet side and environment return side

Pleated filter for greater filtering surface, made of a galvanized sheet frame with a galvanized and electric-welded protective mesh, and regenerable filtering media made from polyester fibre sized with synthetic resins. Efficiency G4 (ISO 16890 Coarse 60%). Self-extinguishing type (flame resistant class 1 - DIN 53438).

Drain pan

Internal section

Inox steel AISI 304 condensate collection tray with anti-condensate insulation, welded, fitted with sleeve for the drain pipe.

Electrical panel

The electrical panel is situated inside the units and is accessed through a hinged door that is opened by a special key.

The capacity section includes:

- main door lock isolator switch;
- compressor circuit breaker;
- compressor power supply remote control switch;
- fan motor thermal protections of internal and external section;
- circuit breaker to protect auxiliary circuit.

The microprocessor control section includes:

- compressor overload protection and timer;
- potential-free contacts for remote ON-OFF, cumulative alarm, fire alarm inlet, fan status, compressor status, summer/winter mode.

Standard unit technical features

Remote control with user interface:

- intuitive graphical interface retro lighted;
- daily/weekly start-up or power-off programming of the unit;
- manual selection of the Comfort or ECO (energy saving) or Ventilation-only mode;
- modification of the temperature and humidity set point;
- unit On/Off and overload reset;
- heating/cooling operating mode manual change;
- display of operating status
- display of alarms and failure code
- display and modification of the operating parameters

Accessories

- VENH - High static pressure fans
- CREFB - Device for fan consumption reduction of the external section, ECOBREEZE type
- FPG4 - Pleated air filter class G4 (ISO 16890 Coarse 60%)
- F7 - High efficiency F7 air filter (ISO 16890 ePM1 55%)
- FES - Electronic filters (ISO 16890 ePM1 90%)
- PSAF - Differential pressure switch for dirty air filters
- PVAR - Variable airflow
- PCOSM - Constant supply airflow
- EXFLOWC - Application in spaces with forced air exhaust at variable flow and exhaust section
- FCE - Enthalpy FREE-COOLING
- PAQC - Air quality probe for CO₂ rate check
- PAQCV - Air quality probe for CO₂ and VOC rate check
- PVMEV- 4-20mA signal for exhaust and supply airflow modulation
- MHP - High and low pressure gauges
- CPHG - Hot gas re-heating coil
- CTEM - Temperature ambient control with built-in probe
- CTERM - Remote keypad for indoor temperature and humidity control
- CSOND - Temperature and humidity ambient control with built-in probes
- EH - Electric heaters
- CHW2 - Two-row hot water coil
- 3WVM - Modulating 2-way valve
- 2WVM - Modulating 3-way valve
- GC - Condensig gas heating module with modulating control
- HSE - Immersed electrodes steam humidifier

- HWS - Water to waste evaporating wet-deck humidifier
- LTEMP1 - Application for low outdoor temperature
- PCMO - Sandwich panels of the handling zone M10 fire reaction class
- CMSC9 - Serial communication module for Modbus supervisor
- CMSC10 - Serial communication module for LonWorks spervisor
- CMSC11 - Serial communication module for BACnet-IP supervisor
- DML - Demand limit
- DESM - Smoke detector
- PM - Phase monitor
- PFCC - Power factor correction capacitors (cosfi > 0.95)
- SFSTC - Progressive compressor start-up Soft starter
- PTCO - Set up for shipping via container
- M3 - Downflow supply
- M5 - Upward supply air
- R3 - Floor air inlet

Accessories separately supplied

- PTAAX - Remote ambient air temperature sensor
- PTUAX - Remote ambient air temperature and humidity probe
- CLMX - Clivet Master System
- RCX - Roof curb
- AMRX - Rubber antivibration mounts
- AMRMX - Rubber antivibration mounts for unit and gas module

All the handling coils can be covered with aluminium - Fin Guard - copper/copper.

Test

Unit manufactured to ISO 9001 standard and commissioned upon production completion.

Configuration with double fan section for recirculation, fresh air, exhaust, THOR thermodynamic recovery (CCKP)

Technical features like the CCK configuration with recirculation, renewal, exhaust air and thermodynamic recovery, modulating motorized outdoor air damper for renewal and e FREE-COOLING and moreover:

- **Exchanger for thermodynamic recovery - THOR**

The energy content of the exhaust air is recovered by a dedicated exchanger, as integral part of the refrigeration circuit. It is a direct expansion finned coil exchanger made with copper pipes placed on staggered rows mechanically expanded to better adhere to the fin collar. The fins are made from aluminium with a corrugated surface and adequately distanced to ensure the maximum heat exchange efficiency.

CSNX-XHE2 **33.4** **CCK** **M0** **R3** **SERMD** **CHW2** **PCOSM** **CREFO**

(1) (2) (3) (4) (5) (6) (7)

1. Configuration

CCK - Configuration with double fan section for recirculation, fresh and exhaust air
CCKP - Configuration with double fan section with fresh air and THOR thermodynamic recovery

2. Air supply

M0 - Horizontal air supply
M3 - Downward air supply
M5 - Upflow air supply

3. Air return

R0 - Horizontal air return
R3 - Downward air return

4. Outdoor air damper

SERMD - Modulating motorized fresh air damper

5. Auxiliary heating

- not required (Std)
EH - Electric elements
CHW2 - 2row hot water coil
GC - Gas heating module

6. Airflow

PCOSM - Supply constant airflow
PVAR - Variable airflow

7. External section fan

CREFO - Device for fan consumption reduction of the external section, on/off type
CREFB - Device for fan consumption reduction of the external section, ECOBREEZE type

How choosing the unit

The selection of the most appropriate size for an installation can be performed starting from the supply airflow value, established this value it is possible to choose among different available thermo-refrigerant treatments.

It is well-known that buildings built with modern technologies, that improve efficiency, have different needs than the previous buildings. In this case, the designer has to design systems with different potentialities.

Example: with airflow at 10000 m³/h, 3 possible cooling capacities are highlighted to do a different treatment, allowing to the designer to have a wide choice.

The sound levels are referred to unit operating at full load in nominal conditions. The sound pressure level is referred at a distance of 1 m. from the ducted unit surface operating in free field conditions. External static pressure 50 Pa. (standard UNI EN ISO 9614-2) Measurements are performed in accordance with the UNI EN 9614-2 standard, in compliance with the requirements of Eurovent 8/1 certification, which provides for a 3dB (A) tolerance on the sound power level - the only data to be considered quite challenging. Please note that when the unit is installed in conditions different from nominal test conditions (e.g. near walls or obstacles in general), the sound levels may undergo substantial variations.

The values shown are to be considered approximate for units operating power in normal use with standard air flow rate..

1. Pressure drops with filters with average dirtiness

Operating range (Cooling)

The limits are meant as a guide. Please note that they have been calculated by considering

- general and non specific sizes
- standard airflow
- non-critical positioning and correct use of the unit
- operation at full load

To verify the operating range of the operating units with percentages of fresh air, always calculate the T_m mixing temperature at the internal heat exchanger input.

T_m = internal exchanger entering air temperature
Temperature measured with wet bulb (W.B.=WET BULB)

Text = inlet air temperature in the external exchanger
Dry bulb measured temperature (D.B.=DRY BULB)

1. Standard operating range
2. Operating range of the unit in FREE-COOLING mode or with automatic distribution of the outdoor ventilation (ECOBREEZE)

WET BULB TEMPERATURE - EXAMPLE

Operating range (Heating)

The limits are meant as a guide. Please note that they have been calculated by considering:

- general and non specific sizes
- standard airflow
- non-critical positioning and correct use of the unit
- operation at full load

To verify the operating range of the operating units with percentages of fresh air, always calculate the T_m mixing temperature at the internal heat exchanger input.

T_m = internal exchanger entering air temperature
Dry bulb measured temperature (D.B.=DRY BULB)

Text = internal exchanger entering air temperature
Temperature measured with wet bulb (W.B.=WET BULB)

1. Operation at full load
2. Field in which the unit operation is allowed only for a limited period (max 1 hour)
3. Operating range of the unit equipped with "Application for low outdoor temperature" and "hot water coil or gas heating module" options. The heat pump circuit is not active

In extended operating mode, in heat pump operation with an fresh air temperature of less than 6°C, the unit performs defrosts by reversing the cycle, so as to eliminate the ice that forms on the surfaces of the outside exchanger; in addition, in the event of negative temperatures, the water resulting from the defrosts must be drained so as to avoid the accumulation of ice near the base of the unit. Make sure that this does not constitute a danger for people or things.

With fresh air temperature within -10°C and -30 °C, the following options will be required: hot water coil or gas heating module and outdoor low temperature set-up.

VENH

High static pressure fans

A higher capacity fan section is available for applications requiring high supply and return head. The option is comprised of radial fans coupled directly to electronically controlled motors (brushless). When you select a unit on the www.clivet.com website, if you enter the air flow, the available supply and return pressure and the accessories that determine the head loss on the air side, you will be automatically shown a selection of high head fans, when required.

CREFB

Device for fan consumption reduction of the external section, ECOBREEZE type

Option indicated to reduce the ventilation electric energy consumption considerably and limit sound emissions inside the external section of the unit. ECOBREEZE logic allows the external axial fans to operate at a variable rotation speed, according to the operation conditions of the cooling circuit. Reducing the speed when the heat load is reduced, benefits the sound emissions, especially during the night, when sensitivity to noise is enhanced. During summer operation, fans can further increase their speed, to respond to situations in which operation limits are temporarily exceeded. ECOBREEZE option uses special fans powered by brushless electrical motors, with complete electronic control, and distinguished by a very high efficiency.

To ensure the continuous cooling operation even at temperatures lower than 15°C, the option is necessary to maintain a proper condensation on the external exchanger.

PCOSM

Constant supply airflow (standard)

The original technology used eliminates the need for on-site calibration of traditional fans, as well as the time that would be required and the associated costs. The required flow rate is set on the display and maintained automatically by the unit, which controls the speed of the ventilating sections. During the installation and start-up phase, the unit controls to the effective pressure drop in the air distribution and diffusion system. Furthermore, during its entire operating life, the progressive fouling of the air filters is automatically compensated for thanks to this system.

PVAR

Variable airflow

Option that enables the automatic variation of the treated air flow, according to the effective load. This allows great energy saving, thanks to the reduction of ventilation electrical consumptions. The minimum flow value equal to 60% of the nominal one occurs during the partial load and satisfied set-point operation. As a result, the supply temperature remains unchanged either during full load operation or partial load operation. The device also includes the functions of configuration of the nominal flow directly on the unit display and its automatic control to compensate the dirtying of the air filters.

⚠ This option already includes the device for controlling the airflow, called 'PCOSM - Supply constant airflow', which must not be selected

⚠ When sizing the distribution and diffusion of the air, keep into consideration that the airflow varies from the nominal value (at full load, in FREE-COOLING mode and during the defrosting phases) to the minimum value, equal to 60% of the nominal flow (at partial load)

EXFLOWC Application in spaces with forced air exhaust at variable flow and exhaust section

Option indicated for conditioning buildings with hoods or active air exhaust systems, for example the cinema projection rooms, catering kitchens, labs with suction hoods, where the fresh airflow is variable in function of the number of active extractors. The option involves an electronic device installed built-in the unit that receives the activation status of the extractors on appropriate potential-free contacts or one 0-10V signal and modulates the fresh air quantity.

The unit is equipped with an exhaust fan section to allow the air renewal also with suction hoods off. The exhaust section is equipped with a plug-fan electronically controlled and managed by the unit logic according to the active suction hoods and the fresh air damper opening. To dimension the unit consider as max. exhaust airflow of the hoods the 80% of the nominal airflow. The air quality probe for controlling the rate of CO₂ / CO₂ and VOC, and the Set-up for spaces with forced exhaust at variable flow' can be simultaneously selected.

Where necessary, the unit will be integrated with further pre-heating options of which 'Electrical heating resistance', '2 range hot water coil' or 'Gas heating module' to guarantee the operation of the unit with 80% of the fresh air in every operating situation, even in low fresh air temperature.

Exhaust and all extractors off

Exhaust and some extractors on

Exhaust and all extractors on

- ⚠ The electronic device is installed and wired built-in the unit.
- ⚠ The option allows to manage up to 4 ON-OFF contacts from the exhaust devices or one 0-10V signal (by Customer)
- ⚠ The connection cables for the 0-10V signal or the ON-OFF status do not require shielding.
- ⚠ Variable airflow' and 'Set-up for spaces with forced exhaust at variable flow and exhaust section' cannot be simultaneously selected.
- ⚠ With minimum fresh air temperatures between 0°C and -8°C foresees the option 'Electrical heating resistance' or '2 range hot water coil' whereas for minimum temperatures between -8°C e -30°C foresees the '2 range hot water coil' or 'Gas heating module' option.

PVMEV 4-20mA signal for the supply and exhaust airflow modulation

Through this option, the supply and exhaust airflow can be adjusted through two external 4-20mA signals, each dedicated to manage the respective ventilation sections and to keep proper pressures in the rooms.

A suitable solution in systems serving several rooms having similar heat load profiles, but separated from each other and occupied in a discontinuous way.

In periods of sanitary emergency, it is suitable for managing a lower airflow than the nominal one, as well as keeping the system on at night, thereby ensuring that internal pollutants are continuously diluted.

The airflow can linearly vary according to the signal received between two airflow levels set in the unit; these values must be selected within the range of the airflow rates allowed for the selected model (values shown in the fans section of the respective technical leaflets).

The PVMEV option disables the 'PCOSM Constant supply airflow' and 'PVAR Variable airflow' options, if available.

PSAF Clogged filter differential pressure switch air side

It makes it possible to detect and signal (with a suitable alarm) when the dirtiness of the air filter reaches its maximum level. This provides the unit operator with information on when filter maintenance is required. The detection signal is installed in the unit. It is already connected to the electrical panel and pre-calibrated in the factory. Calibration can be modified by an authorized personnel.

F7 F7 high efficiency air filter (ISO 16890 ePM1 55%)

The class F7 are filtering components that are in addition to the standard G4 filters, for more effective filtering. They are widely used in air conditioning systems and industrial applications that require suitable performance concerning fine dusts and particles with dimensions greater than 1 µm. Class F7 filters are made of fibreglass paper, pleated with constant calibrated spacing, mounted on a metallic frame; the ample filtering surface reduces air side pressure drops. Class F7 filters must be replaced after reaching their limits of dirtiness with scheduled periodic maintenance. An optional accessory, dirty filter differential switch, can be fitted to signal when admissible limit of fouling has been reached so as not to excessively reduce the airflow with respect to the nominal value.

This option reduces the available static pressure (supply air side).

FES

Electronic filters (ISO 16890 ePM1 90%)

The high efficiency filters with active electrostatic system are additional filtration components of the standard G4 filters. They are active on a wide range of pollutants, including pollen, dust, micro-dust and nano powders, toners, mould, smog, bacteria and viruses with a 98.5% to 99.9% typical efficiency.

The air filtration process follows three main steps defined as “electrostatic precipitation”:

- transfer of a positive electrical charge to particles (ionisation)
- particle capture (uptake)
- removal of captured particles (without filter replacement)

Electronic filters have very high filtration efficiency with very low load drops, and therefore reduced ventilation consumption. Clivet units' typical air crossing speeds ensure filtration efficiencies higher than ISO 16890, and PM1 90% (equivalent to class E10 of absolute filters in accordance with EN 1822).

The normal service lives of electronic filters are as long as that of the whole unit. For this result to be guaranteed and the micro-bicidal action against bacteria and viruses kept steady over time while ensuring minimum load drops, the filters require proper maintenance.

Filters must be cleaned at least every six months; we recommend quarterly or more frequent cleaning if the units are located in excessively polluted areas. Servicing the filters during the unit's routine maintenance includes washing the electronic cells on site and replacing any damaged ionising wires. The Customer should make an area with suitable equipment available for washing near the unit.

The higher initial cost, compared to a traditional pocket filter, can be amortized in a short time; the electrostatic filters' lifespan is indeed the same as that of the unit, whereas pocket filters need periodic replacement.

This option determines a reduction in the available static head (air side).

- ⚠ The clogging of an electronic filter is signalled by a sensor, thus making it possible to schedule periodic maintenance.
- ⚠ Electronic filters are not suitable for filtering water vapours even in low concentrations, oily vapours, large quantities of dust, shavings and iron filing dust, residues in general and gases.
- ⚠ All the following substances must be absolutely avoided with electronic filters: metallic material dust, even very fine; fumes produced by the combustion of organic and non-organic materials; flour dust; dust and vapours from potentially explosive atmospheres.

FCE

Enthalpy FREE-COOLING

This option is used to reduce energy consumption and compressor wear by using the outdoor air as an energy source to lower the thermal loads and ambient humidity. The temperature control compares the temperature and the humidity between the outdoor environment and the served environment and decides the amount of fresh air needed to guarantee the correct temperature and humidity set-points in the environment, keeping the compressors shut off.

The air humidity, both outside and inside the environment, is measured by means of humidity probes on the outdoor and return air intake, which are provided already installed and wired on the unit.

PAQC

Air quality probe for the CO₂ rate check

This option is recommended for areas with highly variable crowding. The probe measures the amount of CO₂ in the environment and initiates a 0/10V proportional signal. Based on the received signal, the controller regulates amount of outdoor air necessary for IAQ ventilation and thus minimises energy used for treatment.

The probe is installed and wired built-in the unit and is located in the return air duct of the unit.

PAQCV

Air quality probe for the CO₂ and VOC rate check

The option is recommended in areas with tobacco smoke, formaldehyde (from solvents, deodorants, glues, paints, detergents, food preparation, etc). The probe measures the rate of CO₂ and VOC (volatile organic compounds) in the environment and initiates a 0/10V proportional signal. Based on the received signal, the controller regulates amount of outdoor air necessary for IAQ ventilation and thus minimises energy used for treatment.

The probe is installed and wired built-in the unit and is located in the return air duct of the unit.

CPHG

Hot gas re-heating coil

This option is recommended during the summer when the intake air dehumidification is required.

The air flow to enter the room may contain a higher level of humidity than desired. The dehumidification process is used to reduce it. The air flow is first cooled in the handling coil with separation of condensation. It is then freely re-heated to maintain the desired condition of comfort in the served room.

The re-heat coil is located behind the handling coil and is activated by diverting a flow of hot refrigerant gas downstream from the compressors through the action of a dedicated solenoid valve.

The process starts operating based on the humidity set-point established by the user.

With respect to traditional devices, such as electrical electric elements or hot water coils, use of the re-heat coil does not consume any extra energy. It also lowers refrigerant condensation temperature, which provides two positive effects: power absorbed by the compressors is considerably reduced, and at the same time, cooling capacity is increased, resulting in greater efficiency (EER).

Ambient humidity is measured by means of a return humidity probe, which is provided already assembled and wired built-in the unit.

This option reduces the available static pressure (supply air side).

1. Outdoor air and humidity / temperature probe
2. Chilled and dehumidified air in the internal exchanger (evaporator)
3. Automatic hot gas pump valve
4. Air treated by the post-heating exchanger
5. External exchanger (condenser)

Indicative scheme - not in scale

Ta = Leaving air temperature from the handling coil and entering the post-heating coil

Qo = Airflow (l/s)

kWt = Heating capacity (kW)

The reheating coil is powered by the cold gas bled from the condensing coil.

As the condensation hot gas temperature is linked to the outdoor air temperature, the indicative potentials of the post-heating coil are expressed according to the outdoor air temperature.

MHP High and low pressure gauges

Allows the pressure measurement of the refrigerant to the compressor intake and supply, making the inspection of these parameters easier for the technicians involved in the management of the unit.
The two liquid pressure gauges and corresponding pressure sockets are installed built-in the unit in an easily accessible location.

CTERM Humidity and temperature control with remote thermostat

This option makes it possible to directly measure the temperature and humidity of the ambient. The automatic thermal regulation is done on the humidity and temperature probes in the thermostat installed in ambient.

CSOND Humidity and temperature control with built-in probes

This option makes it possible to measure the temperature and humidity of the ambient directly on the airflow entering the unit. The automatic thermal regulation is done using the on-board probes, whereas the probes on the remote control are inhibited.

CHW2 Two-row hot water coil

Option indicated for very cold climates, as it allows to heat up the area served. The exchanger comes with a thermostat for the antifreeze function, which is always active even when the unit is in stand-by, as long as it is operated electrically. If required, force the opening of the valve to the maximum value allowed to allow the air to pass through the exchanger and prevent frost from forming.

The hot water coil allows the integration of the heat pump capacity, as being placed before the treating coil, it pre-heats the air, extending the operation limits of the unit. If the water coil operates as integration to the heat pump, the control logic reduces the potential at a pre-determined limit value, which prevents to make the compressors work at too high condensation temperatures. On the other hand, if the water coil is used as main resource (i.e. availability of the compressors) the potential supplied will be the highest.

In the event laws or local standards encourage the use of the district heating, and so the use of hot water coil heating with the obligation to recover the energy contained inside the exhaust air flow, a turning point can be set, that is an outside air temperature, below which the unit uses the water coil as main resource and operates also as thermodynamic recuperator at very high efficiency, using the nominal capacity of the heat pump circuit only partially.

With the option is available a potential-free contact for the water circulator start-up (provided by the Installer).

Hot water coil pressure drops: AIR side

The air side pressure drops are relative to the medium air temperature of 20°C and are to be added to the pressure drops due to ducts, terminal devices and any other component that causes a drop in working discharge head.

QA [m³/h] = Airflow
DP[Pa] = Pressure drops

Hot water coil pressure drops: WATER side

Pressure drops on the water side are calculated considering an average water temperature of 65°C

Q_w [l/s] = Water flow-rate
 DP = Pressure drop [kPa]
 $Q_w [l/s] = P / (4.186 \times DT)$
 P = Water coil heating capacity in KW
 DT = Temperature difference between inlet / outlet water

This option reduces the available static pressure (supply air side).

- ⚠ The component requires connection to the hot water plumbing system (to be provided for by the client).
- ⚠ "2 range hot water coil", 'Electric elements' and gas module cannot be assembled simultaneously.

TM = Air inlet temperature of water coil (°C)

Ti/To = Water temperature inlet/outlet (°C)

Qo = Airflow (l/s e m³/h)

kWt = Provided heating capacity (kW)

Thermal yields referred to the max. water coil capacity. The thermo regulator cokes the 3-way modulating valve limiting the inlet air temperature at desired values.

EH

Electric elements

This option is suggested for cold climates, allows the integration of heating capacity from the heat pump. The electrical heaters are placed before the treatment coil and perform the air preheating function, extending the operating range of the unit and helping quickly to reach the comfort in the room.

Ideal for climate areas in applications with low outside temperature where it is required to active the heaters only for short time in the year. In these cases the resulting system simplification (no water supply) compensates the energy costs.

The fins are made of aluminum, of suitable dimension to ensure high efficiency and maintain low power density on the surfaces to limit overheating. The low temperature of the heating elements increases the lifespan and limits the effect of air ionization.

The minimum operating temperature of the heat pump with electric heater change and depends on the series and the power of the electric heater. The minimum temperature is easily to reckon subtrahend the DT value (previous table) to the entering internal exchanger air temperature $T_m(D.M.)$ for standard unit, at the desired conditions.

The limits are meant as a guide. Please note that they have been calculated by considering:

- general and non specific sizes
- standard airflow
- non-critical positioning and correct use of the unit
- operation at full load

To verify the operating range of the operating units with percentages of fresh air, always calculate the T_m mixing temperature at the internal heat exchanger input.

T_m = internal exchanger entering air temperature
Dry bulb measured temperature (D.B.=DRY BULB)

T_{ext} = internal exchanger entering air temperature
Temperature measured with wet bulb (W.B.=WET BULB)

1. Operation at full load
2. Operating range of the unit equipped with electric elements
3. Operating range of the unit equipped with "Application for low outdoor temperature" and "hot water coil or gas heating module" options. The heat pump circuit is not active.

With fresh air temperature within -10°C and -30 °C, the following options will be required: hot water coil and outdoor low temperature set-up.

2WVM 3WVM

Modulating 2-way valve Modulating 3-way valve

To be combined with hot water coil (optional). It is managed by the built-in microprocessor via a 0-10V signal and allows the fully automatic control of the water coil. The valve with modulating actuator is provided already assembled and wired built-in the unit.

Valve pressure drops

Q [l/s] = water flow-rate
DP [kPa] = pressure drops

⚠ This accessory has to be coupled to the "CHW2 - Two-row hot water coil" option.

HSE

Immersed electrodes steam humidifier

This device is suitable for winter operation when humidity is required for the ambient without cooling the air flow.

The automatic modulating control allows you to adjust the steam production and its relative management costs to the actual requirements.

Available in different capacities, the device is suitable for using soft water having medium conductivity and is equipped with: water load solenoid valve, disposable cylinder, water drainage solenoid valve, distribution nozzle, control electronic board to verify the water level, conductivity, anti-foam device, water drainage manual forcing. To ensure maximum hygiene, the cylinder can automatically empty after a determined period of stand-by.

The accessory is installed inside the unit and is connected to the electrical panel of the unit.

Ambient humidity is measured by means of a return humidity probe, which is provided already assembled and wired built-in the unit.

With the option is available a potential-free contact for the water emptying during the period in which the unit is not used (connection provided by the Customer).

⚠ This option involves variation of the main electrical data of the unit.

⚠ This accessory requires connection to a water supply network and discharge water circuit with adequate frost protection. Installation provided by the Customer.

⚠ Operation is available in heating mode

HWS

Water to waste evaporating wet-deck humidifier

This option is recommended when quick, efficient humidification of the served room during winter operation is required. Humidification of the air mixture occurs by passing the air flow through a honeycomb package that is kept humid at all times by a series of nozzles that inject water in small drops. The reserve of water for treatment is taken directly from the water mains. During operation, the pure water vapour is mixed with the air currents. The remaining part, enriched with mineral salts, is collected in the tub and eliminated. The constant exchange of water ensures cleaning of the evaporation septum and provides maximum limitation of the formation and proliferation of Legionnaire's Disease. With this option, energy consumption for water evaporation is limited. Whenever the packaged humidifier is active, in addition to humidifying, adiabatic cooling of the air takes place, which is constantly compensated for by the thermal control device. Direct connection to the plumbing system eliminates the need for special water treatment and easy control of the humidification process by means of the measuring and adjusting device of the water flow rate provided standard.

The accessory is installed inside the unit and is connected to the electrical panel of the unit.

Ambient humidity is measured by means of a return humidity probe, which is provided already assembled and wired built-in the unit.

Calculation of evaporating water flow from the humidifier

Ta D.B.= dry bulb temperature of inlet air to the wet deck.

Ta W.B.= wet bulb temperature of inlet air to the wet deck.

The table shows the indicative water flow rates for the calibration of the flow rate meter supplied with the wet pack.

The values have been obtained considering an average efficiency of the wet pack equal to 50%

This option reduces the available static pressure (supply air side)

- ⚠ This accessory requires connection to a water supply network and discharge water circuit. To customer care.
- ⚠ Not available if re-heating is present.
- ⚠ during use there will be a part of water that will be dispersed and not totally supplied to the air flow, this to ensure the humidification of the entire surface and to carry out a continuous washing of the septum.
- ⚠ Do not use particularly hard water. The presence of limestone (CaCO₃) may lead to progressive obstruction to water distribution
- ⚠ The humidification effect can be reduced over time depending on the quality of the water used and the progressive deterioration of the component materials.
- ⚠ Operation is available in heating mode

GC Modulating condensation gas heating module

Option consisting of a combustion chamber and condensation burner with modulating control. It is available in various capacities and heats the environment served. The module can be chosen to integrate the heat pump or as an alternative to it. In this case, its heating capacity must be at least equal to the capacity envisioned in the project.

Thanks to the condensation technology with pre-mix and extremely efficient modulation (up to 105% depending on the lower heat value), consumption is very contained and considerably reduced during operation at partial load. The burner with low polluting emissions (NO_x lower than 80mg/kWh) in accordance with Class 5 of European standard EN 676.

The option is supplied on a separate module, easy to connect to the unit during installation.

The gas module presence needs the horizontal supply.

The heating module includes:

- hot air generator with condensation and integrated modulating adjustment, powered with methane gas
- kit for transformation of power with liquefied petroleum gas (LPG)
- kit of steel chimney for exhaust fumes
- all the control and safety devices

This option reduces the available static pressure (supply air side).

⚠ The component requires gas supply (gas connections to be made by the Customer). The location of the unit and the fume drain mode must comply with laws and standards in force in the Country of use.

⚠ The assembly of the chimney kit must be performed on site by the Customer. According to specific requirements of installation, the chimney length can be increased by means of appropriate joints and fittings (not supplied by Clivet). For further details, refer to the Installation, use and maintenance manual.

⚠ Electric elements, '2-row hot water coil' and 'Combustion heating module' cannot be assembled simultaneously.

Accessories

LTEMP1

Application for low outdoor temperature

Option indicated for very cold climates, where the outside temperature can be between -10 and -30°C.

- A. The option includes self-regulating heaters with thermostats that can protect the electrical panel from freezing to make sure it operates correctly.
- B. The special version of the outdoor air damper for the application for low outdoor temperature is made of anti-seize devices that facilitate the correct control of the fresh air in every climatic situation, thanks to the teflon supporting bushings, aluminium flaps, PVC end gaskets and steel leverages to compensate expansions.
- C. The motorised actuator is suitable for operating with low outdoor temperatures.
- D. Electrical connection cables suitable for outdoor low temperatures

- ⚠ This operation involves variation of the main electrical data of the unit.
- ⚠ This accessory operates even when the unit is switched off provided that the power supply is maintained active and the unit continues to be connected.
- ⚠ It is necessary to make precautions against build up of snow and ice in front of the exhaust and outdoor air inlet locations.

PCMO

Sandwich panels of the handling zone in M0 fire reaction class

Option indicated when, by law, the air treatment area must have metallic internal walls made with fire-proof insulating material. Sandwich panels with dual walls made of steel sheet metal with fire-proof insulation made of Rockwool (90 kg/m³) comply with the French standards, which require “M0” reaction to fire class.

CMSC9

Serial communication module for Modbus supervisor

This enables the serial connection of the supervision system, using Modbus as the communication protocol. It enables access to the complete list of operational variables, commands and alarms. Using this accessory every unit can dialogue with the main supervision systems.

The device is installed and wired built-in the unit.

- ⚠ The total length of each serial line do not exceed 1000 meters and the line must be connected in bus typology (in/out).

CMSC10

Serial communication module for LonWorks supervisor

It allows the serial connection to supervision systems, using LonWorks as the communication protocol. It allows access to a list of operating variables, control and alarms compliant with the Echelon standard.

The device is installed and wired built-in the unit.

- ⚠ The configuration and management activities for the LonWorks networks are the responsibility of the client.
- ⚠ LonWorks technology uses the LonTalk® protocol for communicating between the network nodes. Contact the service supplier for further information.
- ⚠ The total length of each serial line do not exceed 1000 meters and the line must be connected in bus typology (in/out).

CMSC11

Serial communication module for BACnet-IP supervisor

Allows the serial connection to supervision systems by using BACnet-IP as a communication protocol. It allows the access to the entire list of operating variables, controls and alarms. With this accessory every unit can communicate with the main supervision systems.

The device is installed and wired built-in the unit.

- ⚠ The configuration and management activities for the BACnet networks are the responsibility of the client.
- ⚠ The total length of each serial line do not exceed 1000 meters and the line must be connected in bus typology (in/out).

DML

Demand Limit

The partial or total activation of the compressors - and the heating electric resistance where present - can be disabled to limit the overall electric capacity absorbed. The external signal is of analogical type 4-20 mA. The greater the signal, the lower the capacity that the unit is enabled to deliver, activating the compressors and the electric elements. The Demand Limit function does not act on the control or on the ventilation, which are therefore always guaranteed, nor on the remaining resources such as hot water coil or the gas heating module.

The represented number of compressors constitutes an indicative example

DESM

Smoke detector

This option allows detection of smoke in the room by analyzing the return air. The Tyndal-effect increased sensitivity smoke detector is perfect for ventilation ducts since it is able to detect rarefied smoke in high-speed air flows. Smoke detection occurs using a photo-optical system with a labyrinth chamber. The alarm signal is processed by a built-in micro-processor which verifies the condition and sends a message to the unit controller such as smoke alarm, failure, or service required. The device is installed inside the return duct and it is made up of a sensor, installed inside the return piping, and of a controller that is located on the outside duct.

Control logics in the event of alarm signal

COMPLETE UNIT SHUTDOWN

SPACE IN OVERPRESSURE

SPACE IN UNDER PRESSURE

The unit is able to manage the signal coming from a fire detection system activating one of the logics illustrated, which can be set by parameters. In presence of alarm signal, the compressors are always switched off; moreover, the remote ON-OFF is disabled together with the switch on/off control from keypad. The unit is manually reset. Rooftop units cannot be used as fume extractor.

⚠ Any fire detection devices built-in the unit must be considered as an auxiliary safety system, and, accordingly, must not be a replacement for any fire detection devices in the room.

PM

Phase monitor

The phase monitor allows verifying the proper phase connection and their unbalance in the units, which are powered by a three-phase system.

The monitor communicates with the control circuit and orders the switch-off of the unit, should one of the following cases occur: improper phase connection, the limit value referring to the unbalance between the phases is exceeded, over/undervoltage for a certain amount of time. Once the line conditions are restored, the unit is reactivated manually.

The device is installed and wired built-in the unit.

PFCC

Power factor correction capacitors (cosfi > 0.95)

The component is necessary to lower the phase difference between current and voltage in the electromagnetic components of the unit, such as asynchronous motors. By re-phasing it is possible to reduce the intensity of the line current by reducing a part of the power of the mains (reactive power). This leads to an economic benefit which the energy provider grants to the final user. The component makes it possible to bring the cosfi power factor to values which on average are greater than 0.95.

The device is installed and wired built-in the unit.

Accessories

SFSTC

Progressive compressor start-up Soft starter

This option is also known as “Soft starter”. An electronic device which automatically starts up the compressors gradually, reducing the starting current for the unit by around 40% in comparison with the nominal value. This results in the electrical capacity system and the related protection devices being sized with lower parameters, thus having a lower initial investment cost.

The device is installed and wired built-in the unit.

PTCO

Set up for shipping via container

Option that allows shipping via container.

It includes the sheet steel slide application for an easy unit scrolling, packaging with protective angle brackets and nylons, anchoring systems. If necessary the lateral lifting brackets and the main isolator switch handle can be removed to avoid damages during transport (components removed and put inside the unit).

For particular requirements, please contact Clivet Shipping Department.

CCCA

Copper / aluminium coil with acrylic lining

Coils with copper pipes and aluminium fins with acrylic lacquering. Can be used in settings with moderately aggressive low saline concentrations and other chemical agents. Attention!

- Cooling capacity variation -2.7%.
- Variation in compressor power input +4.2%.
- Operating range reduction -2.1°C.

- ⚠ Configurable treatment for all the coils of the refrigerant circuit (Treatment, Source, Hot gas post-heating - CPHG, THOR energy recovery).
- ⚠ Water coil treatment (CHW2) available on request

CCCA1

Copper/aluminum coil with Fin Guard (Silver) treatment

A treatment which offers an optimal thermal exchange and guarantees and protects the finned coil exchangers from corrosion over time. Can be used in settings with very aggressive saline concentrations and other chemical agents in the air thus maintaining the performance of the coils over time.

- ⚠ Option available on request.

CCCC

Copper / copper coil

Coils with copper pipes, copper fins and brass structure. Can be used in settings with moderately aggressive saline concentrations and other chemical agents. The options are available for:

- external coil;
- internal coil;
- hot water coil;
- re-heating coil.

- ⚠ This option is not suitable for application in sulphuric environments.
- ⚠ Option available on request.

PTAAX Remote ambient air temperature sensor

Option that allows the adjustment of the unit by a temperature probe placed in the room at a significant point to detect the temperature in the air in quiet. The solution is an alternative to the user interface which can be positioned in a space other than the one to be conditioned. The maximum length of the cable to be connected is 30m.

⚠ Option supplied separately, electrical connection by the customer

PTAUX Remote ambient air temperature and humidity probe

Option that allows the adjustment of the unit with temperature and humidity probes placed in the environment in a significant point to detect the conditions of the air in peace. The solution is an alternative to the user interface which can be positioned in a space other than the one to be conditioned. The maximum length of the cable to be connected is 30m.

⚠ Option supplied separately, electrical connection by the customer

RCX Roof curb

Option that allows to connect the unit to the building roof, ideal with downflow supply and return.

It is made up of two part, a solid steel frame for the air duct connection and a adjustment support in height. Both parts are made of galvanized steel with a steel rain cover profile painted in the same unit colour. It has an adequate support and a duct connection simplification. It is supplied not assembled and it has to be assembled directly in the construction site, to facilitate the transport and installation.

It is complete with adjusting screws to adapt to any slopes or difference in height of the cover. Once the frame is assembled, it will be necessary to insulate and seal the roof curb to the roof to guarantee the resistance to atmospheric agents, later it will be necessary only to place the unit.

⚠ If the gas module is selected, provide for an appropriate support structure, the supply air can only be horizontal
⚠ Installation provided by the Customer.

CLMX Clivet Master System

CLIVET MASTER SYSTEM is the ideal system for the remote and centralised control of the CLIVETPack and SMARTPack climate control units. It can manage up to 10 units connected with a serial connection.

It includes a box for wall installation, as well as the electronic power supply and serial communication devices, a controller with a touch-screen display and a USB port at the front used to export the alarm log.

The device allows to easily and intuitively access all the information on the status of the system and the climate control units. It also provides:

- auto-detection of units connected;
- setting all unit parameters;
- setting of the zone set-point;
- unit status display;
- control and management of the alarms and creation of an alarm log;
- hourly operation scheduling (ON / OFF / ECO);
- rotation of the units even for individual areas;
- temperature, humidity and air quality trends;
- automatic language management (English, Italian, French, Spanish and German).

⚠ The component must be combined with the RS485 serial port option with Modbus protocol built-in of each rooftop.
⚠ Operating temperature from 0°C to 50°C with relative humidity lower than 90% without condensate.
⚠ Installation provided by the Customer.

Accessories separately supplied

AMRX Rubber antivibration mounts

AMRMX Rubber antivibration mounts for unit and gas module

The rubber antivibration mounts must be fixed to designated housings on the support stringers and are used to dampen vibrations produced by the unit, thereby reducing the noise transmitted to the support structures. They are flexible bodies able to dampen axial and tangential stresses and maintain the mechanical properties almost constant over time thanks to high resistance materials of which they are made. Alternatively, rubberized neoprene anti-vibration strips may be used on the unit longitudinal support members (not supplied by Clivet).

⚠ Installation provided by the Customer..

On the web site www.clivet.com are available the performances of the CCK configuration.

Ta = Indoor air temperature D.B/W.B

DB = Dry bulb

WB = Wet bulb

kWf = Cooling capacity in kW

kWs = Sensible cooling capacity (kW)

kWe = Compressor power input in kW

kWt = Heating capacity (kW)

EER referred only to compressors

COP referred only to compressors

The fan motor heating is not considered

Integrated heating capacities

AIR TEMPERATURE EXTERNAL EXCHANGER INLET °C (D.B. / W.B.)	-5 / -5.4	0 / -0.6	5 / 3.9	ALTRI
Heating capacity multiplication coefficient	0,89	0,88	0,94	1

The integrated heating capacity represents the real heating capacity considering the defrost cycles too.

To obtain the integrated heating capacity multiply the heating performance value in kWt (shown in the heating performance tables) by the coefficients indicated in the table.

DB = dry bulb

WB = wet bulb

In case of below zero external air temperature with a long period of heat pump operating mode it is necessary to help the evacuation of the water produced during the defrost cycle; this to avoid the formation of ice in the unit basement. Pay attention that the evacuation will not create inconveniences to things or persons.

Prerformance

Ta = Indoor air temperature D.B/W.B

DB = Dry bulb

WB = Wet bulb

kWf = Cooling capacity in kW

kWs = Sensible cooling capacity (kW)

kWe = Compressor power input in kW

kWt = Heating capacity (kW)

EER referred only to compressors

COP referred only to compressors

The fan motor heating is not considered

Integrated heating capacities

AIR TEMPERATURE EXTERNAL EXCHANGER INLET °C (D.B. / W.B.)	-5 / -5.4	0 / -0.6	5 / 3.9	ALTRI
Heating capacity multiplication coefficient	0,89	0,88	0,94	1

The integrated heating capacity represents the real heating capacity considering the defrost cycles too.

To obtain the integrated heating capacity multiply the heating performance value in kWt (shown in the heating performance tables) by the coefficients indicated in the table.

DB = dry bulb

WB = wet bulb

In case of below zero external air temperature with a long period of heat pump operating mode it is necessary to help the evacuation of the water produced during the defrost cycle; this to avoid the formation of ice in the unit basement. Pay attention that the evacuation will not create inconveniences to things or persons.

Prerformance

Size 33.4 Configurazione CCKP

Cooling performance with 80% of outdoor and exhaust air

Ta = Indoor air temperature D.B./W.B.

DB = Dry bulb

WB = Wet bulb

kWf = Cooling capacity in kW

kWs = Sensible cooling capacity (kW)

kWe = Compressor power input in kW

kWt = Heating capacity (kW)

EER referred only to compressors

COP referred only to compressors

The fan motor heating is not considered

Integrated heating capacities

AIR TEMPERATURE EXTERNAL EXCHANGER INLET °C (D.B. / W.B.)	-5 / -5.4	0 / -0.6	5 / 3.9	ALTRI
Heating capacity multiplication coefficient	0,89	0,88	0,94	1

The integrated heating capacity represents the real heating capacity considering the defrost cycles too.

To obtain the integrated heating capacity multiply the heating performance value in kWt (shown in the heating performance tables) by the coefficients indicated in the table.

DB = dry bulb

WB = wet bulb

In case of below zero external air temperature with a long period of heat pump operating mode it is necessary to help the evacuation of the water produced during the defrost cycle; this to avoid the formation of ice in the unit basement. Pay attention that the evacuation will not create inconveniences to things or persons.

Ta = Indoor air temperature D.B/W.B

DB = Dry bulb

WB = Wet bulb

kWf = Cooling capacity in kW

kWs = Sensible cooling capacity (kW)

kWe = Compressor power input in kW

kWt = Heating capacity (kW)

EER referred only to compressors

COP referred only to compressors

The fan motor heating is not considered

Integrated heating capacities

AIR TEMPERATURE EXTERNAL EXCHANGER INLET °C (D.B. / W.B.)	-5 / -5.4	0 / -0.6	5 / 3.9	ALTRI
Heating capacity multiplication coefficient	0,89	0,88	0,94	1

The integrated heating capacity represents the real heating capacity considering the defrost cycles too.

To obtain the integrated heating capacity multiply the heating performance value in kWt (shown in the heating performance tables) by the coefficients indicated in the table.

DB = dry bulb

WB = wet bulb

In case of below zero external air temperature with a long period of heat pump operating mode it is necessary to help the evacuation of the water produced during the defrost cycle; this to avoid the formation of ice in the unit basement. Pay attention that the evacuation will not create inconveniences to things or persons.

Handling electric fan performance - Standard airflow

The performance takes into account the pressure drops in the unit (pressure drops in handling coil, standard filters, etc.).

To determine the performance required of the fans, you must add to the usable static pressure desired the pressure drops of any accessories.

Prerformance

The performance takes into account the pressure drops in the unit (pressure drops in handling coil, standard filters, etc.).

To determine the performance required of the fans, you must add to the usable static pressure desired the pressure drops of any accessories.

44.4	Airflow	m ³ /h	12500	12500	12500	12500	12500	12500	12500	12500	12500	12500	12500
	Airflow	l/s	3472	3472	3472	3472	3472	3472	3472	3472	3472	3472	3472
	Sound pressure	dB(A)	88,6	89,2	89,9	90,6	91,3	91,9	92,8	93,5	94,3	95,2	95,8
	Total power input	kW	2,94	3,28	3,64	3,98	4,36	4,72	5,10	5,48	5,88	6,32	6,70

The performance takes into account the pressure drops in the unit (pressure drops in handling coil, standard filters, etc.).

To determine the performance required of the fans, you must add to the usable static pressure desired the pressure drops of any accessories.

Performances with "VENH - High static pressure fans" option.

Prerformance

High static pressure electric fan performance - High airflow

The percentage of exhaust air refers to the unit rated flow.

Exhaust electric fans collect from the environment only the quantity of air that will be exhausted.

The data refer to the return static pressure of 150 Pa, which usually occurs in the systems.
